Roll No. : 2

Practical 4

Aim : Creation of account in Metamask, Transfer of Amount/Cryptocurrency from one account to another.

Theory

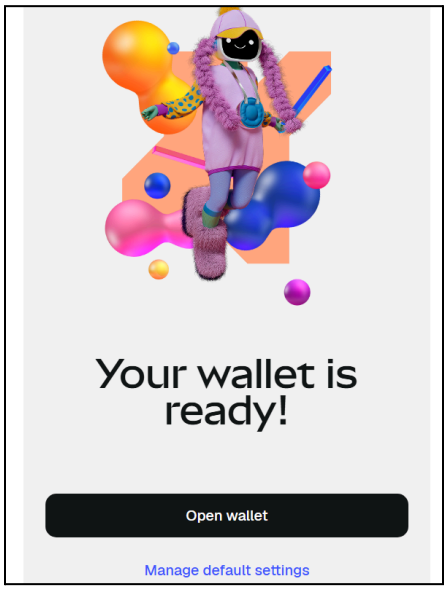

MetaMask is a cryptocurrency wallet used to create and manage digital accounts and perform transactions on blockchain networks such as Ethereum. It provides each account with a unique public wallet address, which is used to receive cryptocurrency, and a private key/Secret Recovery Phrase, which is used to access and secure the account.

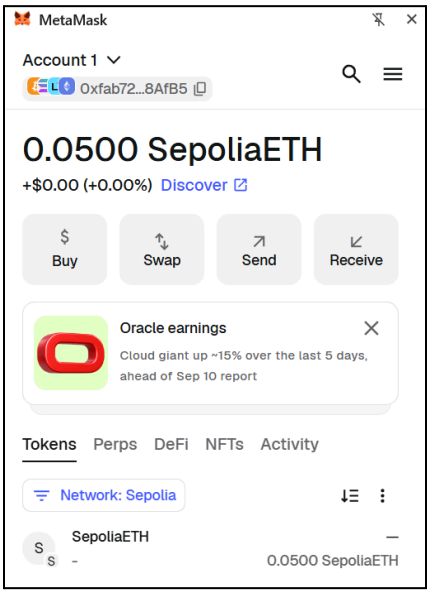

To create a MetaMask account, the wallet is installed and a new account is created by following the setup process. A Secret Recovery Phrase is generated during account creation and must be stored safely and kept confidential.

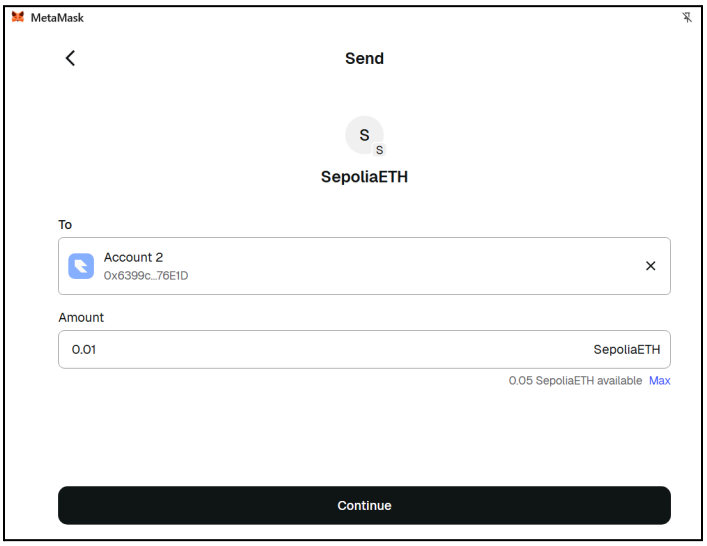

Cryptocurrency can be transferred from one MetaMask account to another using the recipient's public wallet address. The sender enters the recipient's address and the amount to be transferred, checks the transaction details and network fee, and confirms the transaction. The transaction is then processed and recorded on the blockchain.

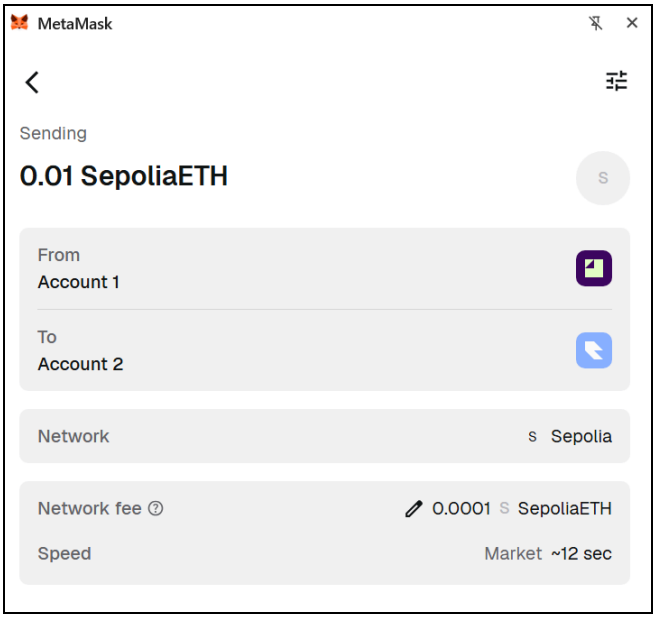

After confirmation, the transferred cryptocurrency is reflected in the recipient's account. The transaction can also be verified using its transaction hash (TxID) on a blockchain explorer. Thus, MetaMask provides a simple way to create blockchain accounts and perform secure cryptocurrency transactions.

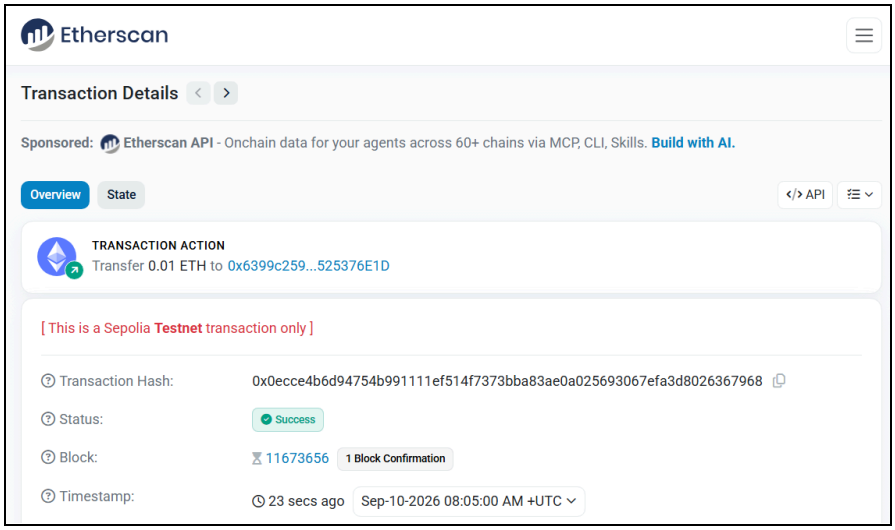

Output

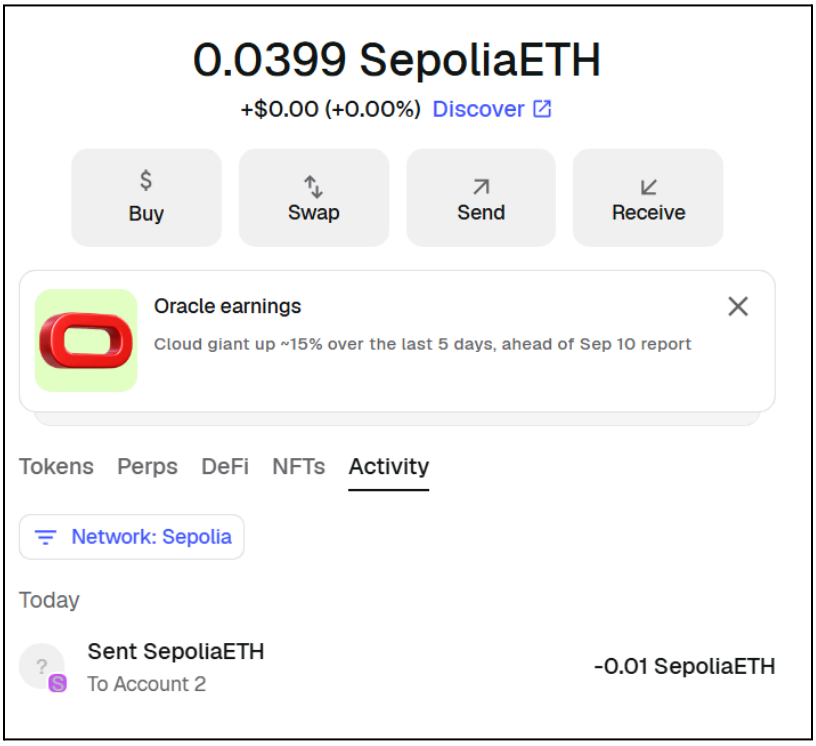

Conclusion

The MetaMask wallet account was successfully created and the basic process of managing a cryptocurrency account was understood. The transfer of cryptocurrency from one MetaMask account to another demonstrated how blockchain-based transactions are initiated, confirmed, and recorded on the network. The experiment also helped in understanding the importance of wallet addresses, transaction fees, and keeping the Secret Recovery Phrase and private keys secure.
